Tropical plant - Full to part sun can get very tall - Up to 7ft in perfect conditions.

Hummingbirds love the color. Plant close to a window to watch them feed. Butterflies enjoy them too.

"I decided that if I could paint that flower in a huge scale, you could not ignore its beauty"
-Georgia O'Keefe (1887-1986), speaking of her work titled *Red Canna*

After care in zones 6 or colder, it is necessary to dig up (lift) in-ground cannas in the fall and bring them inside for the winter. After cutting the canna back, dig out the rhizome with a shovel. Avoid damaging the rhizome by digging about 1 foot away from the stem. With your hands, gently loosen the soil and lift out the clump. Shake off the soil and cut off any foliage. Divide clumps into 3 to 5 rhizomes, each with eyes.

Cure the rhizomes in the sun or in a garage or closet for a few days to toughen them up and help them resist rot. Wrap each rhizome in newspaper or a paper bag, along with a small about of dry growing medium, such as peat moss, to absorb moisture and prevent rot. Rhizomes should not touch each other.

Store cannas over the winter in a dry place where the temperature will not drop below 40°. Often this is a basement, attic, or garage. Check the rhizomes a couple of times over the winter to make sure that they don't dry out. Mist with a bit of water, as needed. If you find rot, trim it away or discard the entire rhizome.

When spring's nighttime temperatures are consistently above 50°F., replant outdoors. Make sure each divided piece has at least one eye; from it, new leaves will grow. Blooms should appear in 10 to 12 weeks. Plants can be left outside in the ground all winter in zones 7 to 10. They will also grow equally well in large containers that can be dragged inside during the dormant period.

Red leaf with red flower canna (Musifolia) using a wine bottle in a watering spike to keep consistent soil moisture.
